## Review Question from Lecture 4

- Give an example of functions  $f$  and  $g$  such that  $f(n)=O(g(n))$  and  $f(n)>g(n)$  for all  $n\geq 1$ .

(Answer:  $f(n)=2n$ ;  $g(n)=n$ )

## Greedy Algorithms

- Build up a solution to an optimization problem at each step shortsightedly choosing the option that currently seems the best.
  - Sometimes good
  - Often does not work

9/10/2007

S. Raskhodnikova; based on slides by K. Wayne.

## Interval Scheduling Problem

- Job  $j$  starts at  $s_j$  and finishes at  $f_j$ .
- Two jobs are **compatible** if they do not overlap.
- **Find:** maximum subset of mutually compatible jobs.

9/10/2007

S. Raskhodnikova; based on slides by K. Wayne.

CSE

## Possible Greedy Strategies

Consider jobs in some natural order. Take next job if it is compatible with the ones already taken.

- **Earliest start time:** ascending order of  $s_j$ .
- **Earliest finish time:** ascending order of  $f_j$ .
- **Shortest interval:** ascending order of  $(f_j - s_j)$ .
- **Fewest conflicts:** For each job  $j$ , count the number of conflicting jobs  $c_j$ . Schedule in ascending order of  $c_j$ .

## Greedy: Counterexamples

9/10/2007

S. Raskhodnikova; based on slides by K. Wayne.

## Greedy Algorithm

- **Earliest finish time:** ascending order of  $f_j$ .

```
Sort jobs by finish times so that  $f_1 \leq f_2 \leq \dots \leq f_n$ .
A ← ∅ Δ Set of selected jobs
for j = 1 to n {
  if (job j compatible with A)
    A ← A ∪ {j}
}
return A
```

- **Implementation.**  $O(n \log n)$  time;  $O(n)$  space.
  - Remember job  $j^*$  that was added last to A.
  - Job  $j$  is compatible with A if  $s_j \geq f_{j^*}$ .

9/10/2007

S. Raskhodnikova; based on slides by K. Wayne.

## Analysis: Greedy Stays Ahead

- **Theorem.** Greedy algorithm is optimal.
- **Pf (by contradiction):** Suppose greedy is not optimal.
  - Let  $i_1, i_2, \dots, i_k$  denote set of jobs selected by greedy.
  - Let  $j_1, j_2, \dots, j_m$  be set of jobs in the optimal solution with  $i_1 = j_1, i_2 = j_2, \dots, i_r = j_r$  for the largest possible value of  $r$ .

## Analysis: Greedy Stays Ahead

- **Theorem.** Greedy algorithm is optimal.
- **Pf (by contradiction):** Suppose greedy is not optimal.
  - Let  $i_1, i_2, \dots, i_k$  denote set of jobs selected by greedy.
  - Let  $j_1, j_2, \dots, j_m$  be set of jobs in the optimal solution with  $i_1 = j_1, i_2 = j_2, \dots, i_r = j_r$  for the largest possible value of  $r$ .

9/10/2007

S. Raskhodnikova; based on slides by K. Wayne.

## Interval Partitioning Problem

- Lecture  $j$  starts at  $s_j$  and finishes at  $f_j$ .
- **Find:** minimum number of classrooms to schedule all lectures so that no two occur at the same time in the same room.
- **E.g.:** 10 lectures are scheduled in 4 classrooms.

9/10/2007

S. Raskhodnikova; based on slides by K. Wayne.

## Interval Partitioning

- Lecture  $j$  starts at  $s_j$  and finishes at  $f_j$ .
- **Find:** minimum number of classrooms to schedule all lectures so that no two occur at the same time in the same room.
- **E.g.:** Same lectures are scheduled in 3 classrooms.

9/10/2007

S. Raskhodnikova; based on slides by K. Wayne.

## Lower Bound

- **Definition.** The **depth** of a set of open intervals is the maximum number that contain any given time.
- **Key observation.** Number of classrooms needed  $\geq$  depth.
- **E.g.:** Depth of this schedule = 3  $\Rightarrow$  this schedule is optimal.

9/10/2007

S. Raskhodnikova; based on slides by K. Wayne.

- **Q:** Is it always sufficient to have number of classrooms = depth?

## Greedy Algorithm

- Consider lectures in increasing order of start time: assign lecture to any compatible classroom.

```
Sort intervals by starting time so that  $s_1 \leq s_2 \leq \dots \leq s_n$ .
d ← 0   Δ Number of allocated classrooms
for j = 1 to n {
  if (lecture j is compatible with some classroom k)
    schedule lecture j in classroom k
  else
    allocate a new classroom d + 1
    schedule lecture j in classroom d + 1
    d ← d + 1
}
```

- Implementation.  $O(n \log n)$  time;  $O(n)$  space.
  - For each classroom, maintain the finish time of the last job added.
  - Keep the classrooms in a priority queue.

9/10/2007

S. Raskhodnikova; based on slides by K. Wayne.

## Analysis: Structural Argument

- **Observation.** Greedy algorithm never schedules two incompatible lectures in the same classroom.
- **Theorem.** Greedy algorithm is optimal.
- **Proof:** Let  $d$  = number of classrooms allocated by greedy.
  - Classroom  $d$  is opened because we needed to schedule a lecture, say  $j$ , that is incompatible with all  $d-1$  last lectures in other classrooms.
  - These  $d$  lectures each end after  $s_j$ .
  - Since we sorted by start time, they start no later than  $s_j$ .
  - Thus, we have  $d$  lectures overlapping at time  $s_j + \epsilon$ .
  - Key observation  $\Rightarrow$  all schedules use  $\geq d$  classrooms. ■
